

# Dictionary

Drag Assign on sequence page

(x) Assign	
Save to	Value to Save
{3} dict	= {3} New Dictionary (Of Int32, string)

(x) Assign	
Save to	Value to Save
{3} dict(301)	= {3} "RPA"

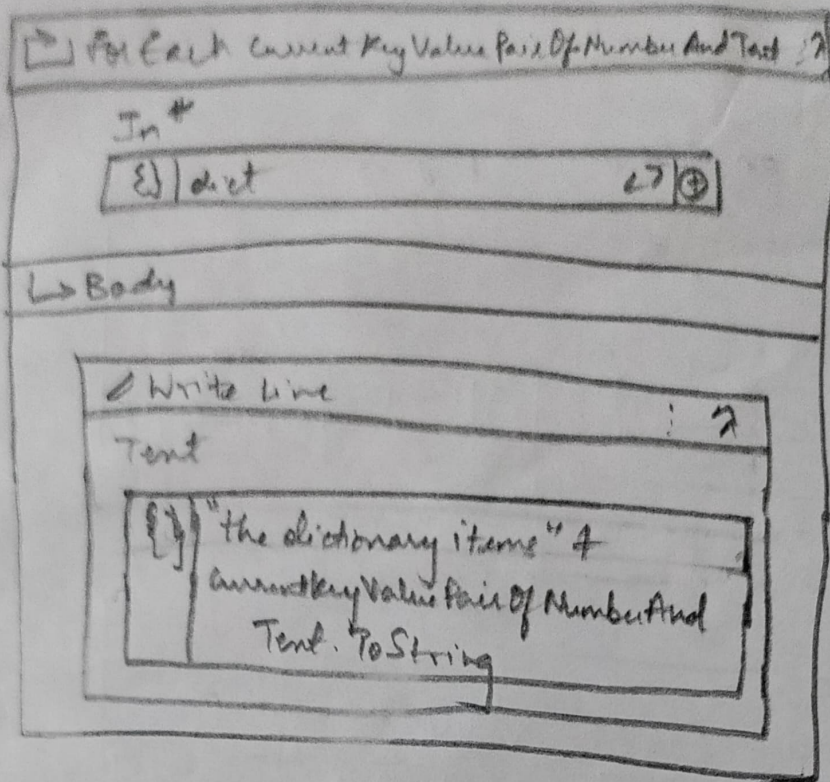

(x) Assign	
Save to	Value to Save
{3} dict(302)	= {3} "IOT"

(x) Assign	
Save to	Value to Save
<del>{3} dict(303)</del>	<del>= {3} "NLP"</del>

(x) Assign	
Save to	Value to Save
{3} dict(304)	= {3} "AML"

(x) Assign	
Save to	Value to Save
{3} dict(305)	= {3} "ECON"

### Output.

the dictionary items [301, RPA]  
 the dictionary items [302, TOP]  
 the dictionary items [303, NLP]  
 the dictionary items [304, AMLE]  
 the dictionary items [305, ECOM]

## Collections - List

- Drag assign activity  
value as -> new list (of string)
- Drag 'Append items to collection'

Append items to collection :

Collection

List 17/10

Items

2 items in 1 17

"iot"  
"vpa"

- Append few more collections
- Remove from collection

Collection

List

Remove el

☐ specific team

Item

"vpa" 17/10

- ~~Drag exists in collection~~

Exists in collection : 17

Collection\*

List 17/10

Item

"iot" 17/10

- Drag Message Box

Text

"available" 17/10

- Drag for each current text

- Debug it → run file

off: dot  
nlp  
npe  
nlp

TRUE

## Experiment-7

Date: 11/3/25

7. Perform automation for customizing selectors.

### AIM

To perform automation for customizing selectors, you can follow these steps using UiExplorer and editing selectors in the properties of activities.

### PROCEDURE

1. **Identify the Target Element**
  - Open UiPath Studio and create a new project or open an existing one.
  - Identify the UI element you want to interact with in your automation process.
2. **Use UiExplorer to Customize Selector**
  - Click on the "Indicate element inside browser" or "Indicate element inside window" option in the UiPath Studio toolbar.
  - Hover your mouse over the target element, and UiExplorer will highlight it.
  - Click on the target element to inspect its properties in UiExplorer.
3. **Customize Selector Properties**
  - In UiExplorer, review the properties of the selected element.
  - Customize the selector properties as needed to ensure a robust and reliable selection.

- Adjust the selector to include unique attributes that identify the element, avoiding properties that may change dynamically.
  - Use wildcards (\*) where necessary to handle dynamic attribute values.
  - Remove unnecessary or volatile properties from the selector to improve stability.
4. **Validate Selector**
    - After customizing the selector, click on the "Validate" button in UiExplorer to ensure that the selector correctly identifies the target element.
    - Verify that the selector is unique and does not match unintended elements on the screen.
  5. **Update Selector in Activity Properties**
    - Open the activity (e.g., Click, Type Into) that interacts with the target element.
    - In the properties pane of the activity, locate the "Selector" field.
    - Paste the customized selector into the "Selector" field to replace the default selector.
  6. **Test the Automation**
    - Test the automation process to verify that the customized selector correctly identifies and interacts with the target element. Run the workflow and observe the behavior of the activities interacting with the element

### SOURCE CODE

#### Selectors:

In UiPath, selectors are xml strings that define the unique properties of UI elements, like id, name, title, class, etc. The selector identifies an element on the screen for automation purposes.

#### Dynamic Selectors:

These selectors can be modified programmatically at run time to adapt to changing UI structures.

## Steps to Automate Selector Customization in UiPath.

### 1) Basic Setup for UiPath Automation:

- \* Open UiPath Studio
- \* Create a new process
- \* Use the selector Editor in activities like click, type into ....

### 2) Modify Selectors Dynamically:

UiPath provided a way to manipulate selectors dynamically during execution using variables or expressions. Here's an example for how you can customize 2 selectors dynamically.

Ex: Automating Dynamic Selector Customization:

Step 1: Capture the selector

2: Make the selector dynamic

3: Use variables for Dynamic Selectors.

4: Ex. use Dynamic Selectors in workflow.

5: Handle Dynamic Elements in multiple places.

6: Using find Element with Dynamic selectors.

Tips for Automating Selectors Dynamically in UiPath

1) Use Wildcards.

2) Anchor Base

3) Selector Editor

4) Debugging

5) Attributes

Lab Record

5) By leveraging dynamic selectors in Vite, you can automate applications where UI elements might change over time, allowing your automation to remain flexible and robust.
